

Phase 8 – Data Management & Deployment

This phase focused on understanding how Salesforce manages, protects, and moves data between environments. It covered importing data into Salesforce, avoiding duplicate records, backing up information, and deploying customizations from one org to another. These activities are essential for keeping data accurate, secure, and consistent in a production system.

1. Data Import Wizard

Definition:

The Data Import Wizard is a built-in Salesforce tool that lets you upload and insert data records into Salesforce without installing any extra software. It is ideal for small to medium-sized data loads (up to 50,000 records).

What we did:

- Navigated to **Setup** → **Data Import Wizard**.
- Selected **Custom Objects** such as *Event*, *Ticket*, and *Vendor*.
- Chose **“Add New Records”** to load initial data sets.
- Uploaded our prepared CSV files containing Event, Ticket, and Vendor details.
- Used the field-mapping screen to match CSV columns to Salesforce fields (e.g., Event Name → Name field).
- Enabled **“Trigger workflow rules and processes”** so that automations run after import.
- Verified that imported records appeared correctly on their respective object tabs.

Benefit:

This step ensures data can be quickly brought into Salesforce from spreadsheets or other systems, reducing manual entry and saving time.

ScreenShot :

The screenshot shows the Salesforce Data Import Wizard interface. At the top, there's a navigation bar with 'Setup', 'Home', and 'Object Manager'. Below this, a progress bar indicates the current step: 'Getting closer'. The main area is divided into three columns: 'Choose data', 'Edit mapping', and 'Start import'. The 'Choose data' column shows 'Standard objects' and 'Custom objects' tabs. Under 'Custom objects', 'Event records' is selected with a green checkmark. The 'Edit mapping' column shows 'Add new records' with a green checkmark. It includes options for 'Match by' (set to '-None-'), 'Which User field in your file designates record owners?' (set to '-None-'), and a checkbox for 'Trigger workflow rules and processes?' which is checked. The 'Start import' column shows 'Where is your data located?' with a green checkmark. It includes a 'File' section with 'events.csv' and 'Character Code' set to 'ISO-8859-1 (General US & Western European, ISO-LATIN-1)'. The 'Values Separated By' is set to 'Comma'. At the bottom, there are 'Cancel', 'Previous', and 'Next' buttons.

2. Duplicate Rules

Definition:

Duplicate Rules prevent users from creating or editing records that would result in duplicates. They work together with Matching Rules, which define the criteria used to identify duplicates.

What we did:

- Went to **Setup → Duplicate Rules → New Rule**.
- Object: **Event Record**.
- Rule Name: *Event Duplicate Rule*.
- Description: *Used for removing duplicate entities*.
- **Record-Level Security**: Selected “Enforce sharing rules” so only permitted records are checked.
- **Actions**:
 - On Create: **Alert & Report** (shows a warning when a duplicate is about to be created and logs it in a report).
 - On Edit: **Alert & Report**.
 - Alert Text: “Use one of these records?” to guide the user.
- Selected a matching rule to compare Event records based on fields like Name or Date.
- Activated the rule.

Benefit:

Improves data quality and user trust by preventing duplicate event records.

Screen shot:

The screenshot displays the Salesforce Setup interface for configuring a Duplicate Rule. The left sidebar shows the navigation menu with 'Setup' selected, and 'Duplicate Rules' highlighted under 'Data' > 'Duplicate Management'. The main content area is titled 'Duplicate Rules' and shows the configuration for the 'Event Duplicate Rule'.

Event Duplicate Rule Configuration:

- Rule Name:** Event Duplicate Rule
- Description:** used for removing duplicate entities
- Object:** Event record
- Record-Level Security:** Enforce sharing rules
- Action On Create:** Allow
- Action On Edit:** Allow
- Alert Text:** Use one of these records?
- Active:** ☒
- Conditions:** (Empty)
- Created By:** mtd.shahib 9/25/2025, 4:28 PM
- Modified By:** mtd.shahib 9/25/2025, 4:28 PM

Operations On Create: Alert ☒ Report ☒
Operations On Edit: Alert ☒ Report ☐

Buttons: Edit, Delete, Clone, Activate

3. Data Export & Backup

Definition:

Salesforce offers a built-in Data Export feature that allows administrators to download all org data for backup or migration purposes. This is essential for disaster recovery and auditing.

What we did:

- Navigated to **Setup → Data Export**.
- Scheduled a weekly export including Event, Ticket, and Vendor objects.
- Chose “Include Attachments and Files” to back up all related documents.
- Downloaded the .zip files provided by Salesforce for safe storage.

Benefit:

Provides an offline backup of critical business data, ensuring it can be restored or analyzed outside Salesforce if needed.

ScreenShot :

The screenshot shows the Salesforce Setup interface for the Data Export feature. The left sidebar contains the Setup menu with 'Data Export' selected under the 'Data' section. The main content area is titled 'Monthly Export Service' and includes a description of the service. A yellow banner indicates that the next scheduled export is currently in progress. Below this, there are buttons for 'Export Now' and 'Schedule Export'. A table at the bottom shows the export details: Scheduled By (md.ahmed), Schedule Date (9/25/2025), and Export File Encoding (ISO-8859-1).

SETUP Data Export

Monthly Export Service

Data Export lets you prepare a copy of all your data in salesforce.com. From this page you can start the export process manually or schedule it to run automatically. When an export is ready for download you will receive an email containing a link that allows you to download the file(s). The export files are also available on this page for 48 hours, after which time they are deleted.

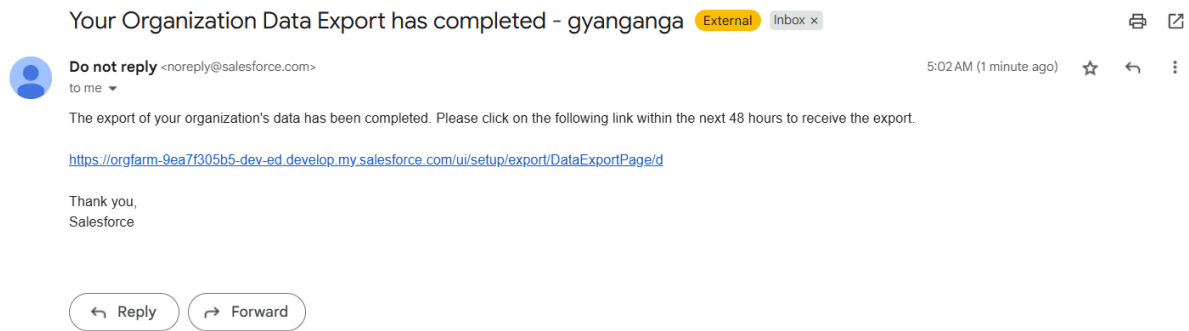

Next scheduled export:
A data export is currently in progress for your organization.

Export Now Schedule Export

Your export has been queued. You will receive an email notification when it is completed.

Scheduled By	md.ahmed
Schedule Date	9/25/2025
Export File Encoding	ISO-8859-1 (General US & Western European, ISO-LATIN-1)

4 . Change Sets (Deployment)

Definition:

Change Sets are a Salesforce feature for migrating customizations (metadata) from one Salesforce org to another (for example, from a sandbox to production). This allows teams to test changes before going live.

What we did:

- Went to **Setup** → **Outbound Change Sets**.
- Created a new change set named *EventManagerment_ChangeSet*.
- Added components such as custom objects, fields, validation rules, and automation built in earlier phases.
- Uploaded the change set to the target org.
- Verified and deployed the change set in the destination org.

Benefit:

Allows controlled, repeatable deployment of customizations without manual re-creation, reducing errors and downtime.
